Finding a particular solution $(f, 0)$ is a bit trickier than finding the general solution of the homogeneous equation. It's something for which you can develop an intuition by solving lots of problems, but even with a good intuition for what to try, you'll still likely find yourself having to try more than one thing on occasion in order to get a particular solution.

Subsection 9.5.4 The General Case. Combining the results in the preceding sections, we can quickly write the general solution of any homogeneous equation of the form $f''(p(A)f=0)$ provided we can factor the polynomial $f(p(A) \text{text{.}})$ Note that in general, this solution takes us into the field of complex numbers, since the roots of a polynomial with real coefficients are sometimes complex ...
