Box–Jenkins method. In time series analysis, the Box–Jenkins method, named after the statisticians George Box and Gwilym Jenkins, applies autoregressive moving average (ARMA) or autoregressive integrated moving average (ARIMA) models to find the best fit of a time-series model to past values of a time series .

Follow. In this paper, we will analyze the international passenger data series (G), as mentioned in the textbook Time Series: Forecast and Control by Box, Jenkins and Reinsel (ISBN: 978-0470272848). This textbook was first published in late 1960s, and is considered by many practitioners as the definite foundation textbook on the time series topic. The international airline passenger series describes monthly totals of the international passengers for the period between Jan 1949 and Dec 1960.

Time Series Analysis: Forecasting and Control, Fifth Edition provides a clearly written exploration of the key methods for building, classifying, testing, and analyzing stochastic models for time series and describes their use in five important areas of application: forecasting; determining the transfer function of a system; modeling the effects of intervention events; developing multivariate dynamic models; and designing simple control schemes. Along with these classical uses, the new ...

The book by Box and Jenkins, Time Series Analysis Forecasting and Control (the later edition is Box, Jenkins and Reinsel, 1994) has a discussion on these forecast functions on pages 326 - 328. Again, if you have only a faint notion, but you do know that there was a trend upwards before differencing, pick a seasonal MA term and see what comes out in the diagnostics.

Time Series Analysis: Forecasting and Control - George E ...

The Box-Jenkins methodology is a five-step process for identifying, selecting, and assessing conditional mean models (for discrete, univariate time series data). Establish the stationarity of your time series. If your series is not stationary, successively difference your series to attain stationarity.

The first step in the Box-Jenkins procedure is to difference the time series until it is stationary, thereby ensuring that trend and seasonal components are removed. In many instances one or two stage differencing is sufficient. The differenced series will be shorter than the source series by c time steps, where c is the range of the differencing.
