A Compressed Air Engine is a type of engine which uses compressed air technology to generate useful work output. The idea is to store compressed air inside a tank. The compressed air inside the tank has large amount of energy, and this energy can be used to move the piston of an engine. The back and forth movement of piston inside the engine cylinder results in generation of useful work energy . II. History . The history of Compressed Air Technology (CAT) is not new to industries.

1.1 Compressed Air Engine Basics: A Compressed-air engine is a pneumatic actuator that creates useful work by expanding compressed air. A compressed-air vehicle is powered by an air engine, using compressed air, which is stored in a tank. Instead of mixing fuel with air and burning it in the engine to drive pistons with hot expanding gases,

Design and Fabrication of Compressed Air Engine.

The pre compressed air in the tanks is transferred to a chamber (called "active") which provides "work" before being expanded in the cylinders to perform the stroke phase. There are no polluting emissions generated and the use of renewable energy in the air filling stations allows the production of a completely clean energy loop (compression - expansion). A compressed-air vehicle is a transport mechanism fueled by tanks of pressurized atmospheric gas and propelled by the release and expansion of the gas within a Pneumatic motor. CAV's have found application in torpedoes, locomotives used in digging tunnels, and early prototype submarines. Potential environmental advantages have generated public interest in CAV's as passenger cars, but they have not been competitive due to the low energy density of compressed air and inefficiency of the compressio

Compressed air is commonly also used, at lower pressures, to control the engine and act as the spring force acting on the cylinder exhaust valves, and to operate other auxiliary systems and power tools on board, sometimes including pneumatic PID controllers. One advantage of this approach is that in the event of an electrical blackout, ship systems powered by stored compressed air can continue functioning uninterrupted, and generators can be restarted without an electrical supply.

Compressed air cars are powered by motors driven by compressed air, which is stored in a tank at high pressure such as 31 M Pa (4500 psi or 310 bar). Rather than driving engine pistons with an ignited fuel-air mixture, compressed air cars use the expansion of compressed air, in a similar manner to the expansion of steam in a steam engine.
