GDDM (Graphical Data Display Manager) is a computer graphics system for the IBM System/370 which was developed in IBM's Hursley lab, and first released in 1979. GDDM was originally designed to provide programming support for the IBM 3279 colour display terminal and the associated 3287 colour printer. The 3279 was a colour graphics terminal designed to be used in a general business environment.

It first appeared back in 1959, when IBM and General Motors developed Design Augmented by Computers-1 (DAC-1), the first ever CAD system, for creating automobiles on a computer screen. Drawing on a computer screen with a graphics package is a whole lot easier than sketching on paper, because you can modify your design really easily.

This unique work details a set of general graphics routines that C programmers can apply not only to the original IBM color graphics adapter but also to the popular Hercules Graphics Card and compatible monochrome graphics adapters. Focusing on low-level routines, text defines and discusses the elementary routines inigr, move, draw, and endgr. Concrete examples of both hardware and software are used to illustrate the range of graphics capabilities on both vector and raster devices.
