Lab 5: The vertebrate skeleton. Geo 302D: Age of Dinosaurs.

LAB 3: The Vertebrate Skeleton. Bone is a connective tissue unique to vertebrates. It serves several purposes: - It is a reservoir for chemicals used in metabolic processes, - It provides structural support for soft tissues, - It acts as armor to shield vulnerable body parts, - It is a framework upon which muscles can exert forces to facilitate movement.

Vertebrate Skeletons Lab Answers - test.enableps.com

The vertebrate skeleton General characteristics. In vertebrates the adult skeleton is usually formed of bone or cartilage—living substances that grow with the animal, in contrast to the many types of invertebrate skeleton that do not grow or are dead secretions, deposits, or crystals. The internal position of bones and their central position in limbs provide firm support for small and large animals.

Skeleton - The vertebrate skeleton | Britannica
axial skeleton includes the skull, vertebral column, ribs, and sternum while the appendicular skeleton is composed of the appendages and their supporting girdles. The third portion of
